NM OAI Study Webinar

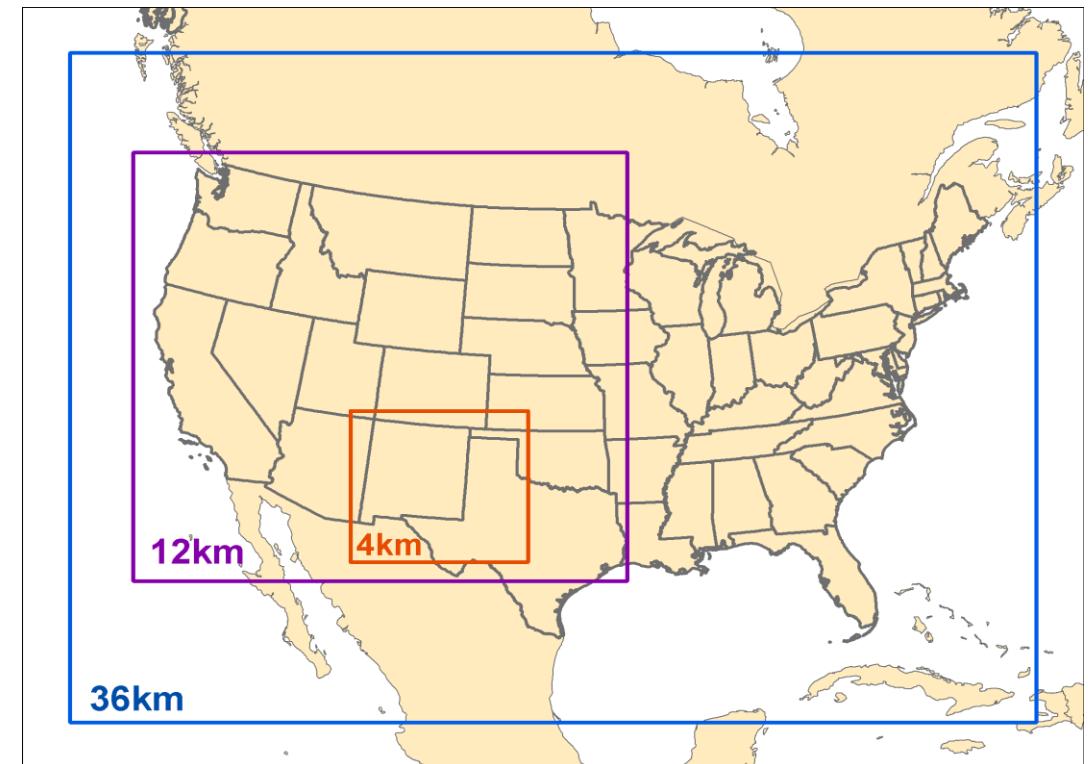

April 21, 2021

# **2028 VOC/NOX SENSITIVITY OSAT OZONE SOURCE APPORTIONMENT**

- 01** CAMx Ozone Source Apportionment Tools and Differences Between OSAT and APCA
- 02** Highlights of 2028 Source Sector APCA Ozone Source Apportionment Modeling (presented at April 2, 2021 Webinar)
- 03** 2028 VOC/NOx Sensitivity OSAT Ozone Source Apportionment Modeling Results
- 04** Draft Final Air Quality Technical Support Document (AQTSD)

# CAMX 2014 NM OAI STUDY MODEL CONFIGURATION

- Episode: May-August 2014
  - 16-day spin-up before first high ozone day in NM
    - 68 ppb on May 17
- 36/12/4-km Modeling Domains
  - 36/12-km domains same as WRAP Regional Haze
  - New 4-km New Mexico domain
- Boundary Conditions (BC) WRAP 2014 GEOS-Chem
- Four Meteorological Diagnostic Sensitivity tests
  - Selected WRF/NAM with Kv=CMAQ
- WRAP 2014v2 base year emissions
  - EPA NEI2014v2 w/ western state updates
- WRAP 2028OTBa2 for future year w/ 2014 actual fires and new 2028 NM O&G

# CAMX OZONE SOURCE APPORTIONMENT TOOLS

- **Ozone Source Apportionment Technology (OSAT)** • 10 Reactive Tracers used for each Source Group
  - OSAT uses tagged species/reactive tracers to calculate contributions of VOC and NOx emissions from user-defined Source Groups to ozone concentrations that are VOC sensitive ( $O_3V$ ) and ozone concentrations that are NOx sensitive ( $O_3N$ )
    - Accounting system that operates in parallel to host model extracting ozone source apportionment information
    - User-defined Source Groups can be Source Regions and/or Source Categories and includes all sources (including BCs) of ozone (e.g., on-road mobile sources from New Mexico)
  - When ozone is formed, OSAT determines whether ozone formation is more sensitive to VOC or NOx emissions and allocates it to Source Group's ozone tracers ( $O_3V$  or  $O_3N$ ) based on the relative contribution of the more sensitive ozone precursor (VOC or NOx)
    - $V_i$  = VOC emissions
    - $NIT_i$  = Nitric oxide (NO) & nitrous acid (HONO) emissions
    - $RGN_i$  = Nitrogen dioxide (NO<sub>2</sub>), nitrate radical (NO<sub>3</sub>) and dinitrogen pentoxide (N<sub>2</sub>O<sub>5</sub>)
    - $TPN_i$  = Peroxyl acetyl nitrate (PAN), analogues of PAN and peroxy nitric acid (PNA)
    - $NTR_i$  = Organic nitrates (RNO<sub>3</sub>)
    - $HN3_i$  = Gaseous nitric acid (HNO<sub>3</sub>)
    - $O3N_i$  = Ozone formed under NOx-limited conditions from  $N_i$
    - $O3V_i$  = Ozone formed under VOC-limited conditions from  $V_i$
    - $OON_i$  = Odd-oxygen in NO<sub>2</sub> formed from  $O3Ni$
    - $OOV_i$  = Odd-oxygen in NO<sub>2</sub> formed from  $O3Vi$

# CAMX OZONE SOURCE APPORTIONMENT TOOLS

- **Anthropogenic Precursor Culpability Assessment (APCA)**

- APCA differs from OSAT in that it only allocates ozone formed to the Natural (e.g., biogenic) Source Groups when it is due to Natural VOC reacting with Natural NOx
  - For example, ozone formed due to biogenic VOC reacting with anthropogenic NOx under VOC emissions sensitive conditions, a case OSAT assigns to Natural Source Group O3V, APCA redirects ozone formed to anthropogenic Source Group O3N
- APCA provides more control strategy relevant information and is used in ozone contribution assessments, while OSAT provides information on whether ozone formation is more sensitive to VOC or NOx emissions
  - APCA used in EPA's Cross State Air Pollution Rule (CSAPR) to identify when an upwind state's anthropogenic emissions contributes significantly to nonattainment in a downwind state
  - APCA also used in NMED OAI Study 2028 Local Source APCA ozone source apportionment modeling
- If analyzing whether ozone formation is more sensitive to VOC or NOx emissions, then OSAT source apportionment or a sensitivity method (e.g., DDM/HDDM or Brute Force) must be used
  - NM OAI Study 2028 VOC/NOx sensitivity OSAT ozone source apportionment modeling

# CAMX 2028 O&G CS SOURCE SECTOR APCA OZONE SA

- **Definition of Source Groups**

- Boundary Conditions (BCs) from WRAP 2014 GEOS-Chem runs:

- $BC_{Intl}$  - International anthropogenic emissions
- $BC_{USA}$  – U.S. anthropogenic emissions
- $BC_{Natural}$  – Natural sources
- $BC_{Top}$  – BC above the top of domain

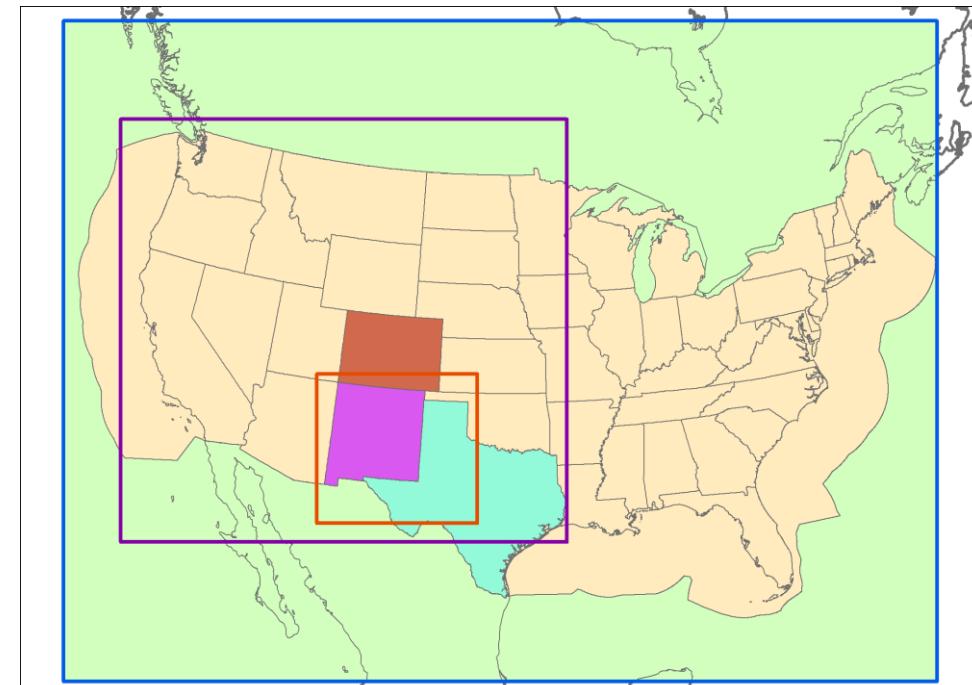

- Source Categories (9):

1. Natural (biogenic, lightning NO<sub>x</sub>, etc.);
2. Fires (WF, Rx, Ag, other);
3. Oil and gas point sources (surrogate for midstream);
4. Oil and gas non-point sources (surrogate for upstream);
5. EGU point;
6. Non-EGU point;
7. On-road mobile;
8. Non-road mobile; and
9. Remainder anthropogenic.

- Source Regions (5):

- New Mexico
- Texas
- Colorado
- Remainder U.S.
- International (Mex, Can, CMV > 200 nmi)

- 50 Source Groups ( $50 = 5 \times 9 + 5$ )

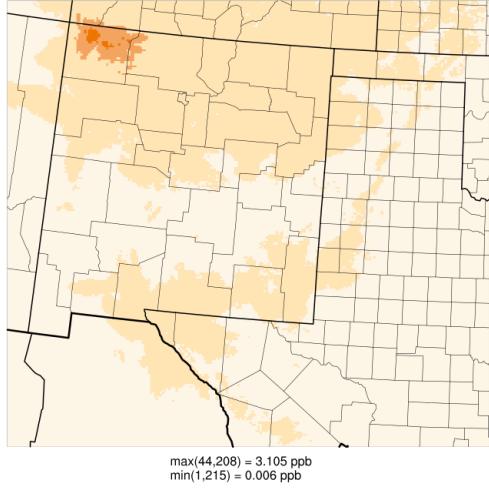

# REDUCTIONS 2028 OZONE DVFS NEW MEXICO SOURCE SECTORS

- 2028 ozone DVF Reductions from New Mexico Source Sectors
  - O&G Point: -0.1 to -0.9 ppb
  - O&G Non-Pt: -0.1 to -2.1 ppb
  - EGU Point: 0.0 to -3.1 ppb
  - Non-EGU Pt: 0.0 to -1.1 ppb
  - On-Road: -0.1 to -2.7 ppb
  - Non-Road: -0.1 to -1.9 ppb
  - Other Anthro: 0.0 to -3.6 ppb

# CAMX 2028 O&G CS OSAT OZONE SOURCE APPORTIONMENT

- Use the OSAT version of CAMx ozone source apportionment tool
  - OSAT O3V and O3N tracers give indication of whether ozone formation is more VOC or NOx sensitive
- Definition of Source Groups
  - Source Regions (5):
    - Use same 5 Source Regions as APCA SA run
  - Source Categories (3):
    - Anthropogenic Emissions
    - Natural (Biogenic, lightning NOx, WBD, oceanic)
    - Fires (U.S. WF, Rx and Ag and other)
  - 17 Source Groups (5 x 3 + 2 [IC,BC])
    - Runs faster than CAMx APCA SA Run (50 Source Groups)
- Post-Processing
  - Compare amount of ozone that is formed under more VOC sensitive vs. NOx sensitive conditions

# SPATIAL MAPS OF OSAT VOC/NOX OZONE SENSITIVITY

- Use O<sub>3N</sub> and O<sub>3V</sub> tracers from emissions-based Source Groups to determine amount of ozone formed under VOC sensitive versus NOx sensitive conditions:
  - Percent NOx Sensitive Ozone Formation =  $100 \times O_{3N} / (O_{3V} + O_{3N})$  Scale Used →
- Daily spatial maps of MDA8 ozone concentrations and percent ozone formed under NOx emissions sensitive conditions
  - Total MDA8 ozone from all Source Groups ( $O_{3V} + O_{3N} + O_{3BC}$ )
    - Boundary Condition (BC) ozone defined by 2014 GEOS-Chem run so no information on VOC/NOx sensitivity
  - MDA8 ozone and percent NOx sensitive ozone for all emissions-based Source Groups
    - ( $O_{3V} + O_{3N}$ ) from anthropogenic, fire and natural emissions Source Categories and all 5 Source Regions
  - MDA8 ozone and percent NOx sensitive ozone for all anthropogenic emissions Source Groups
  - MDA8 ozone and percent NOx sensitive ozone for New Mexico anthropogenic emissions
    - Provide control strategy relevant information on relative importance of New Mexico VOC and NOx emissions

## All Regions Anthro

## New Mexico Anthro

# PERCENT NO<sub>X</sub> SENSITIVE OZONE FROM NEW MEXICO ANTHROPOGENIC EMISSIONS ON 15 HIGHER OZONE DAYS

# DASHBOARD OF OSAT RESULTS AT MONITORING SITES

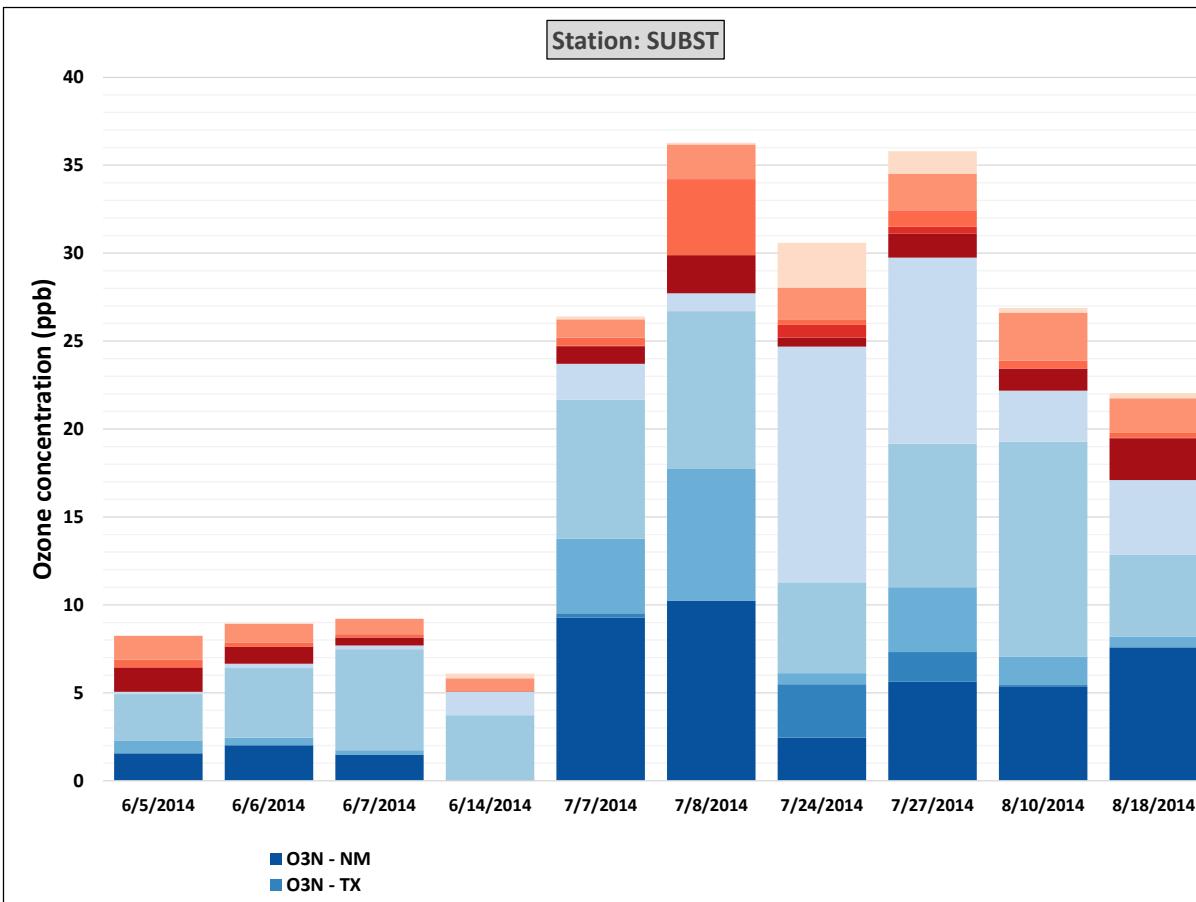

- Select display: monitoring site; 10 days to visualize (SMAT, 2028 1-10, 11-20, etc.); Source Categories (Anthro, Fires, Natural); Source Regions (NM, CO, TX, Remaining U.S. Intl.)
- Displays: Stacked Bar Charts of 10 days O3V and O3N; Pie Chart average across 10 days
  - Cooler colors for NOx sensitive ozone, warmer coolers for VOC sensitive ozone

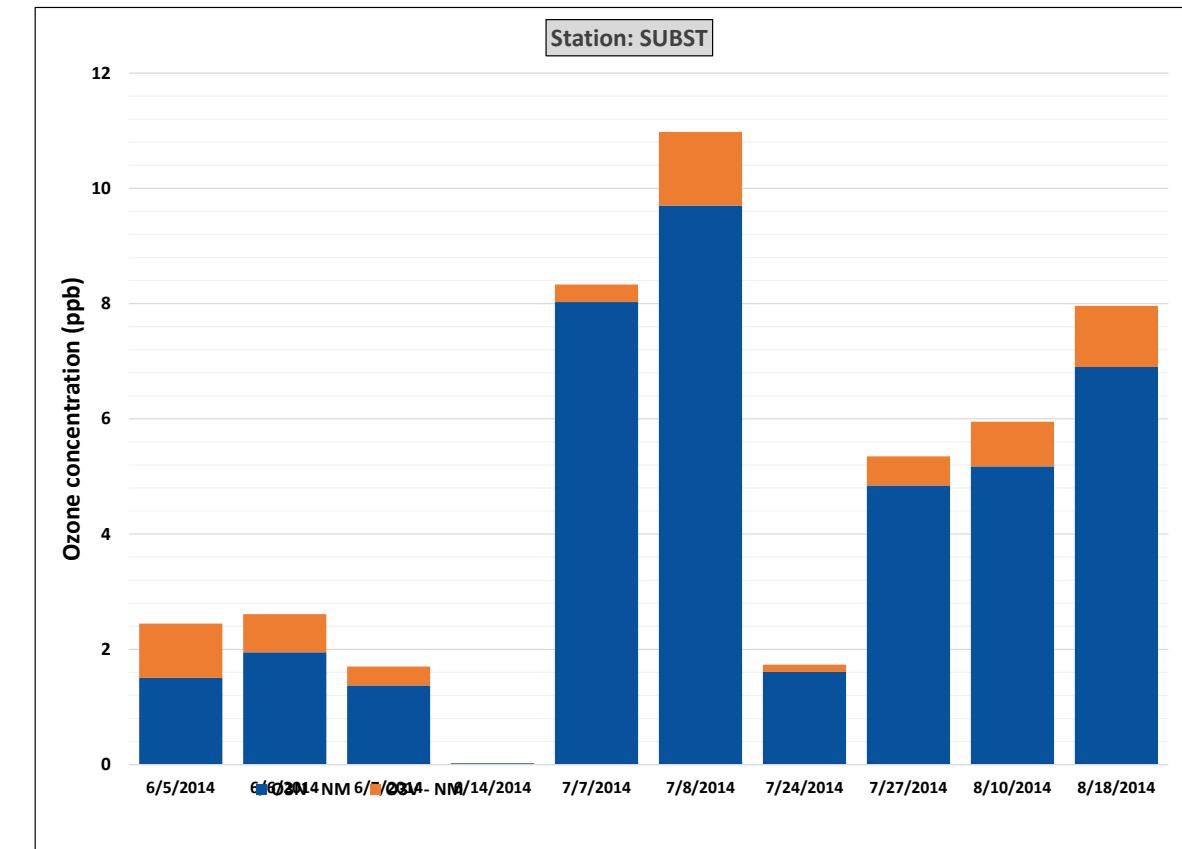

# SUBSTATION, SAN JUAN COUNTY – 10 SMAT DAYS

- Lots of day-to-day variation in ozone contributions and percent VOC vs. NOx sensitive ozone
- 70% - 90% NOx sensitive MDA8 ozone

All Source Categories and Regions

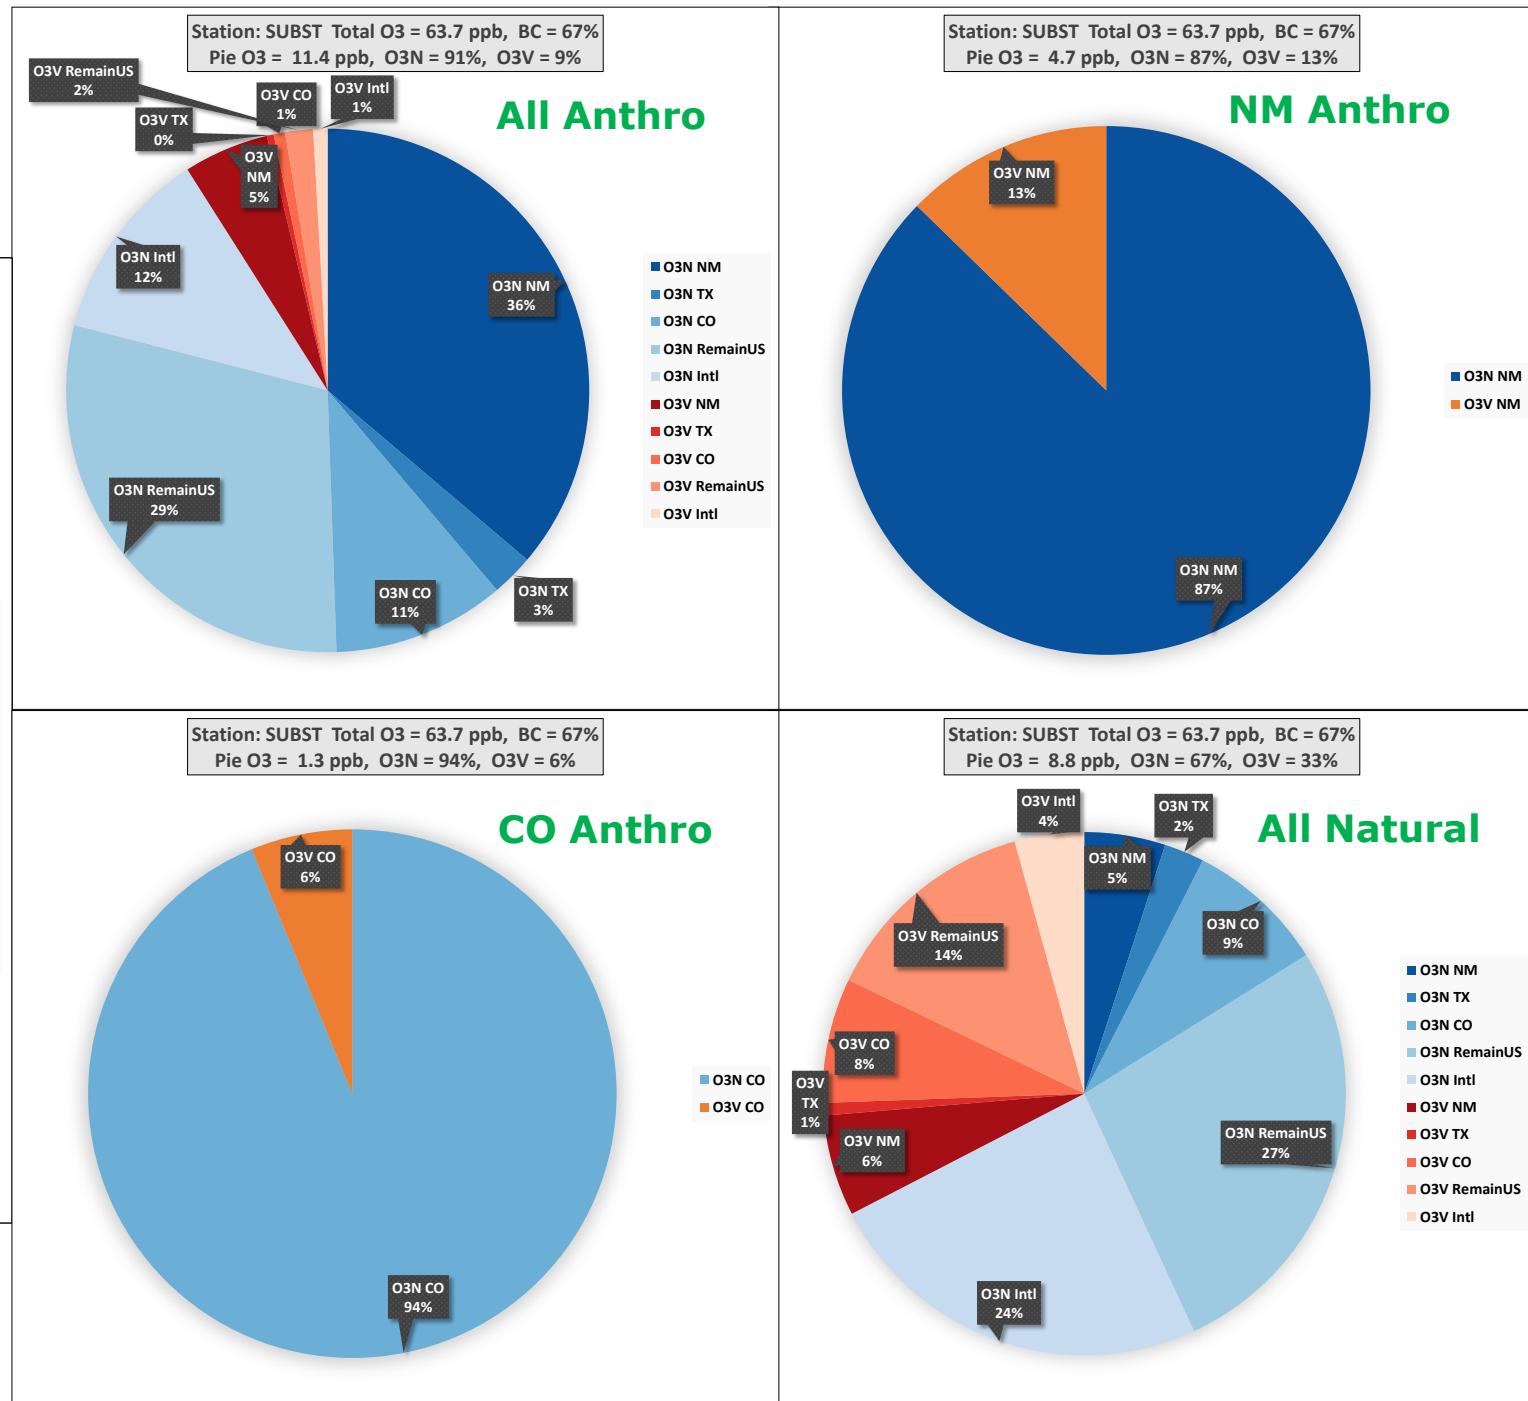

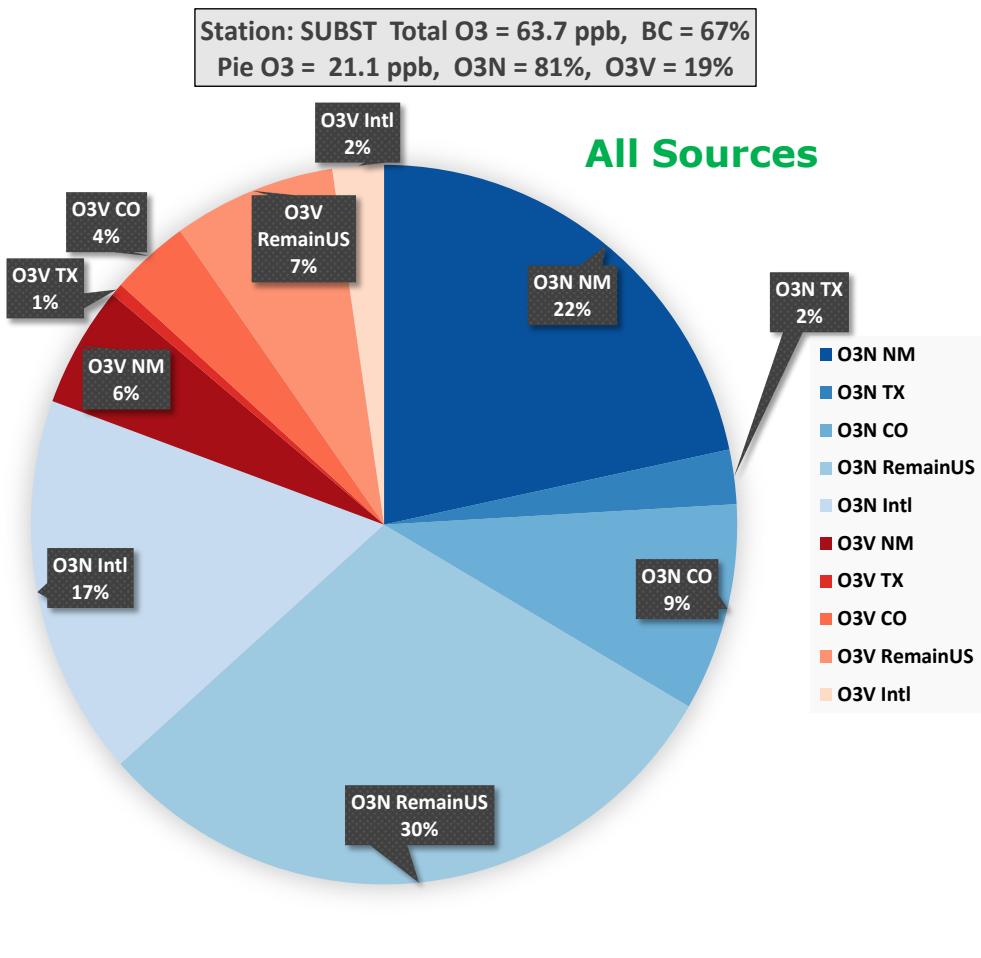

New Mexico Anthropogenic

# Substation, San Juan County

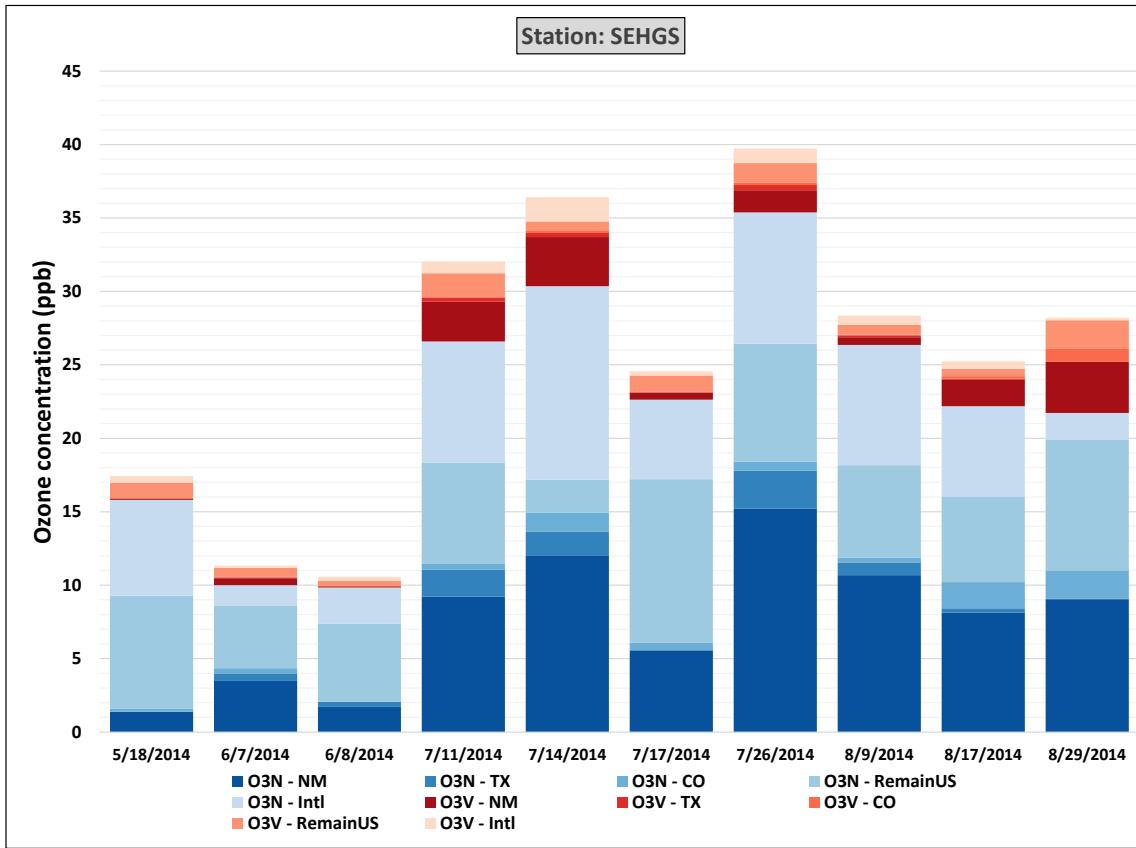

## Average 10 SMAT Days

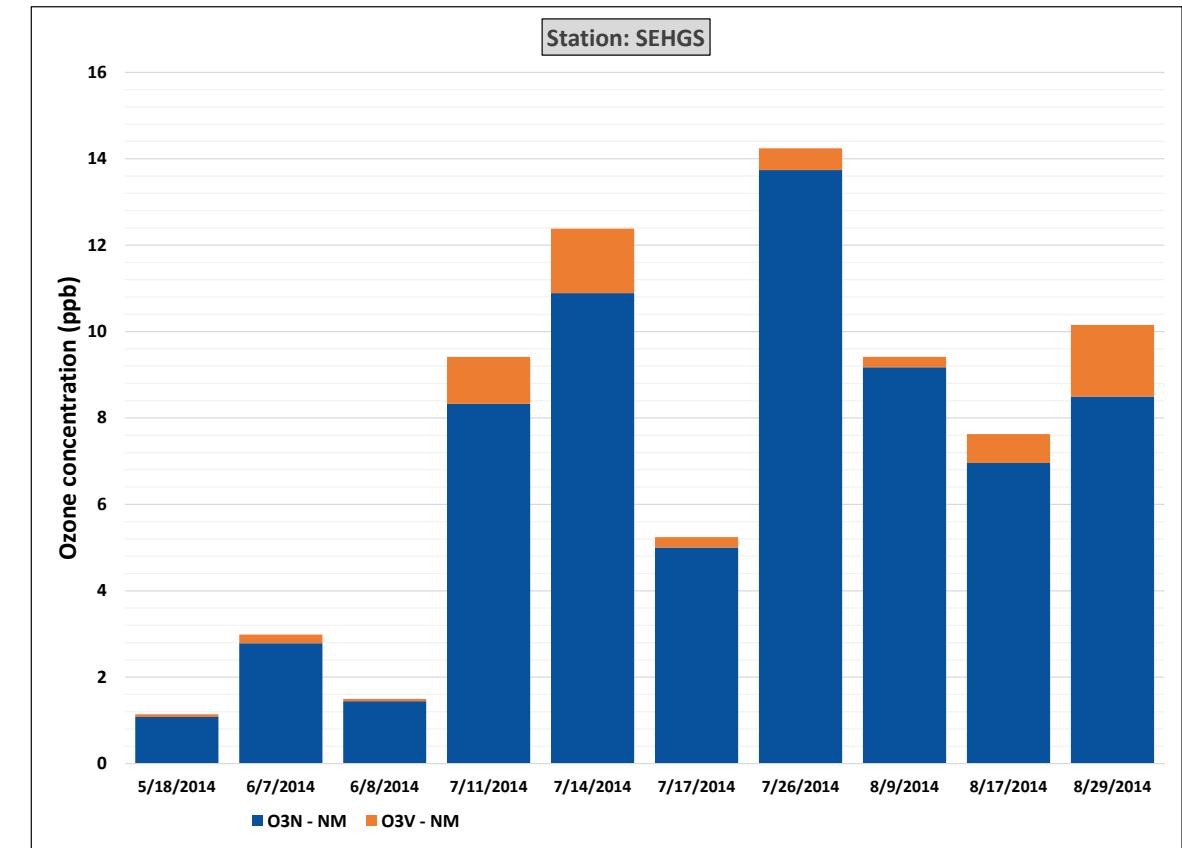

# SOUTH EAST HEIGHTS, BERNALILLO COUNTY – 10 SMAT DAYS

- Lots of day-to-day variation in ozone contributions and percent VOC vs. NOx sensitive ozone
- Vast majority is NOx sensitive ozone, a little less VOC sensitive ozone than Substation

All Source Categories and Regions

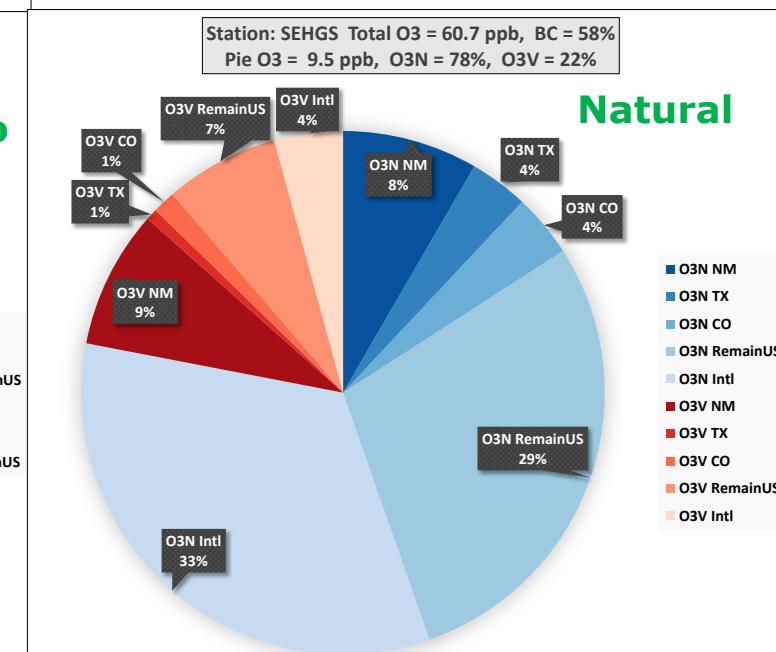

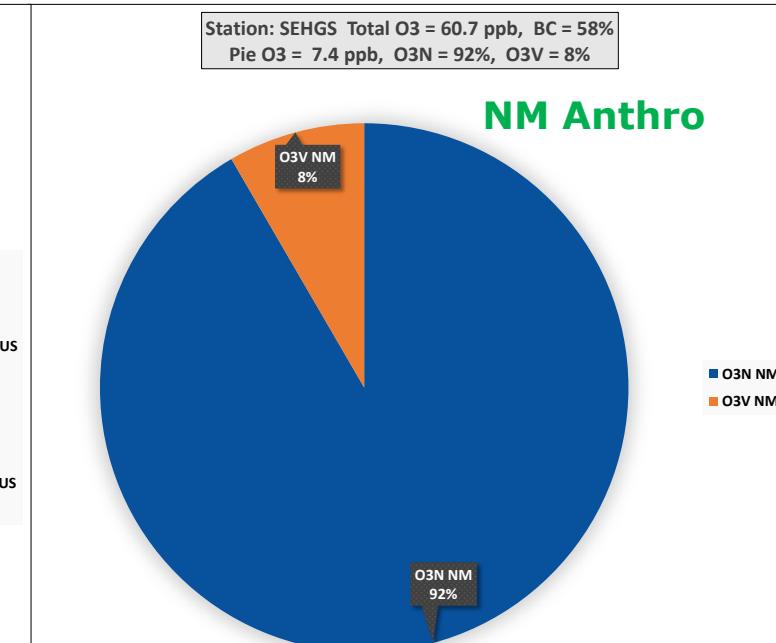

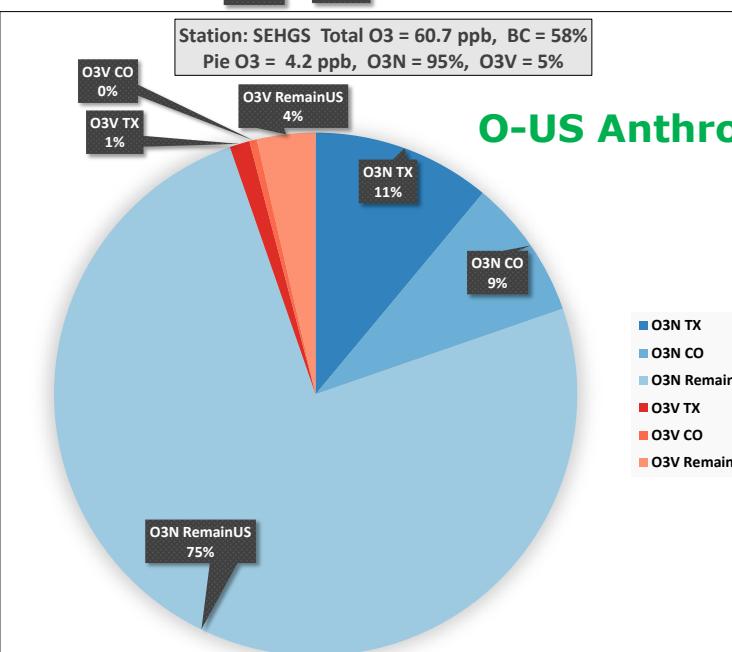

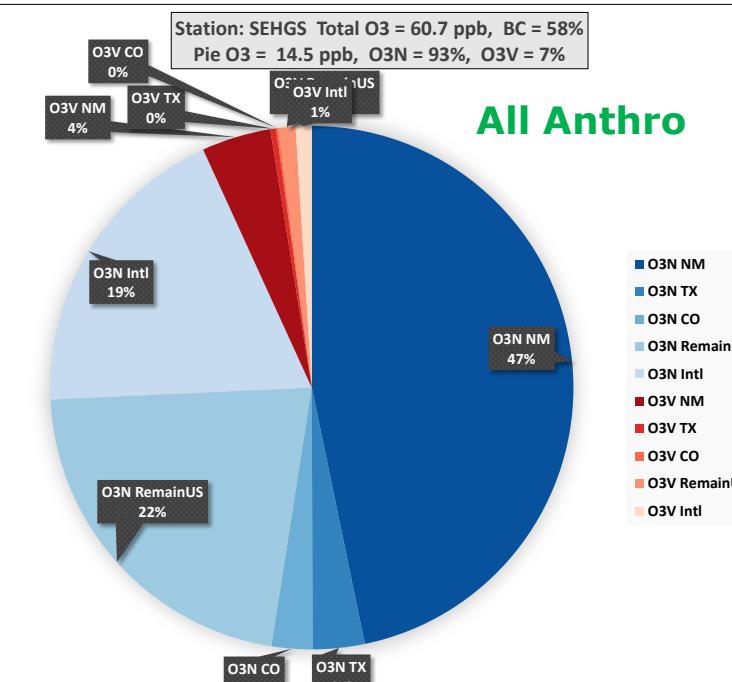

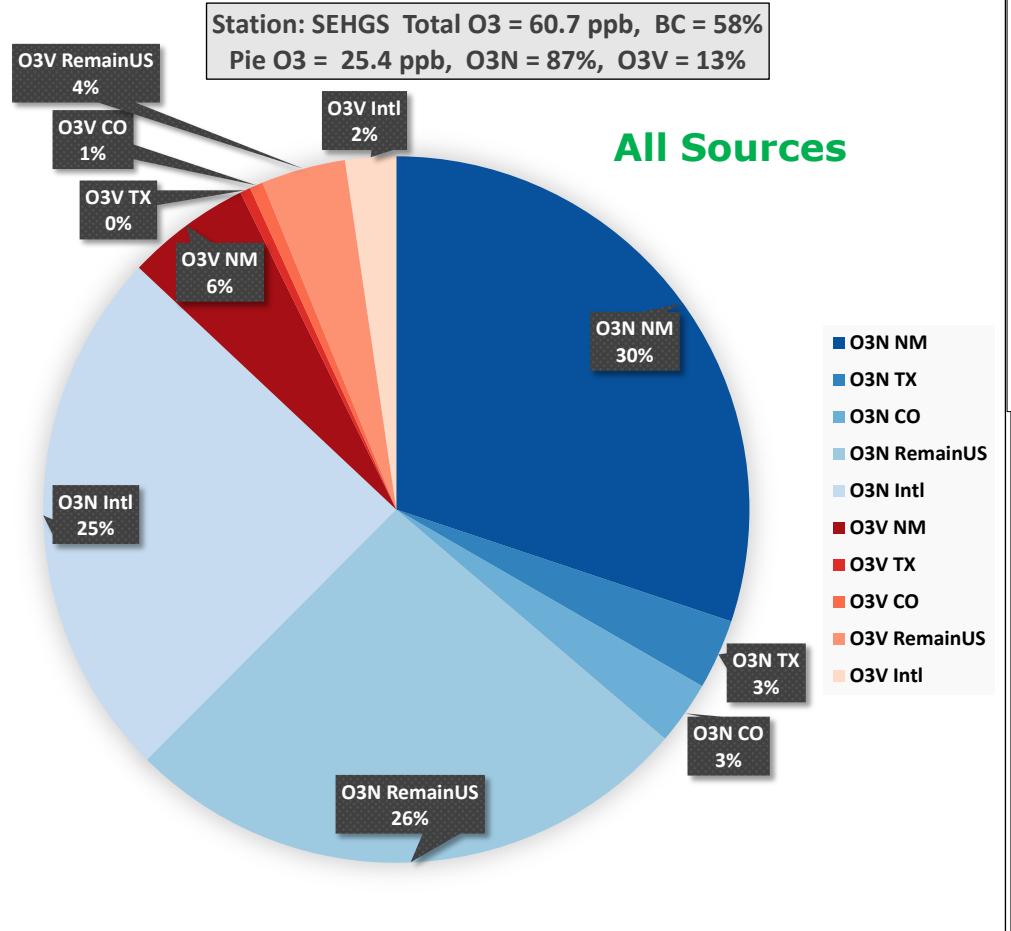

New Mexico Anthropogenic

# SE Heights, Bernalillo County

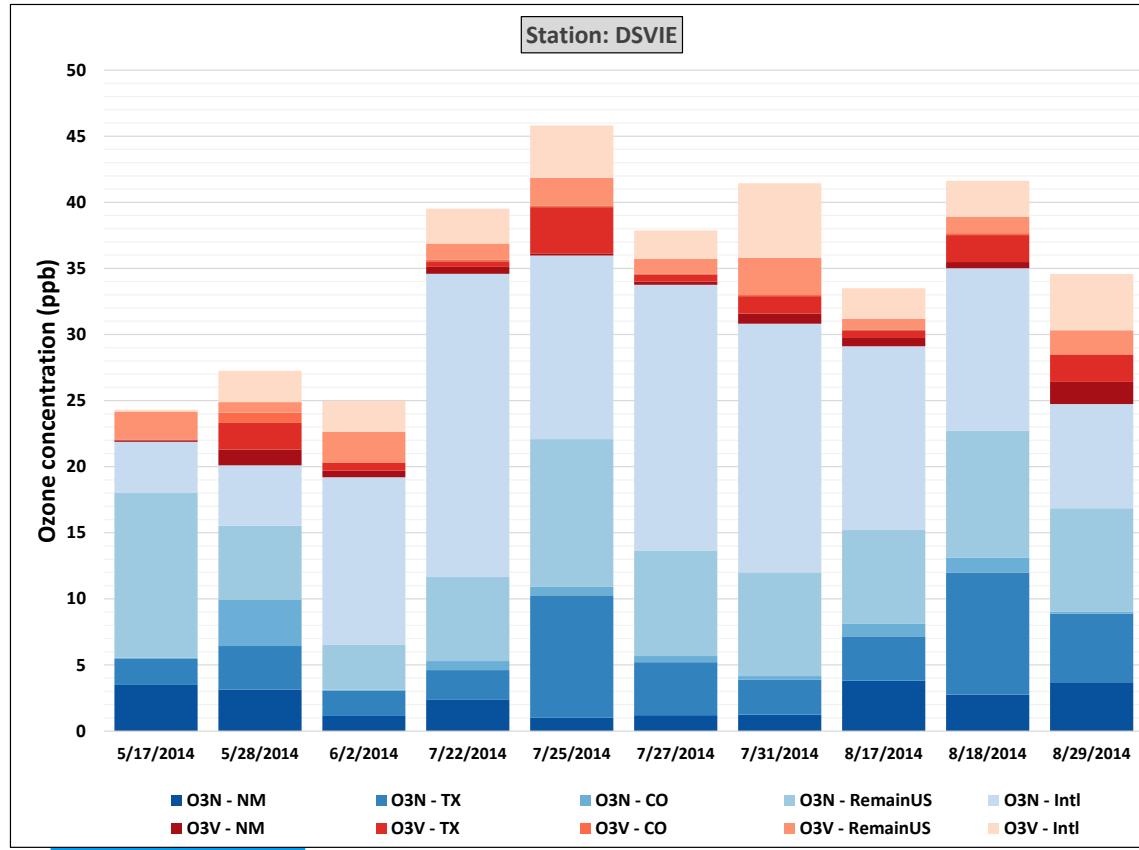

## Average 10 SMAT Days

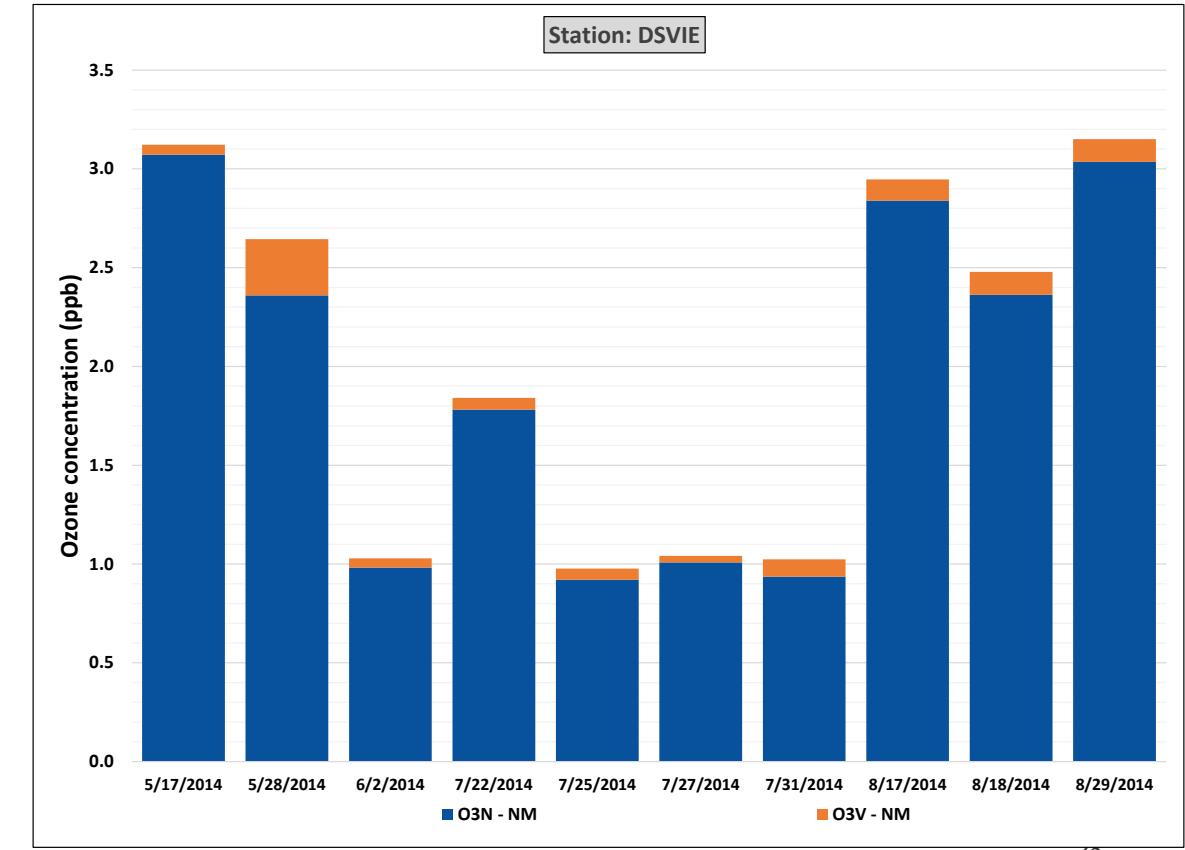

# DESERT VIEW, DONA ANA COUNTY – 10 SMAT DAYS

- Mostly NOx sensitive ozone, but more VOC sensitive than other sites due to El Paso
- New Mexico contributions NOx sensitive

## All Source Categories and Regions

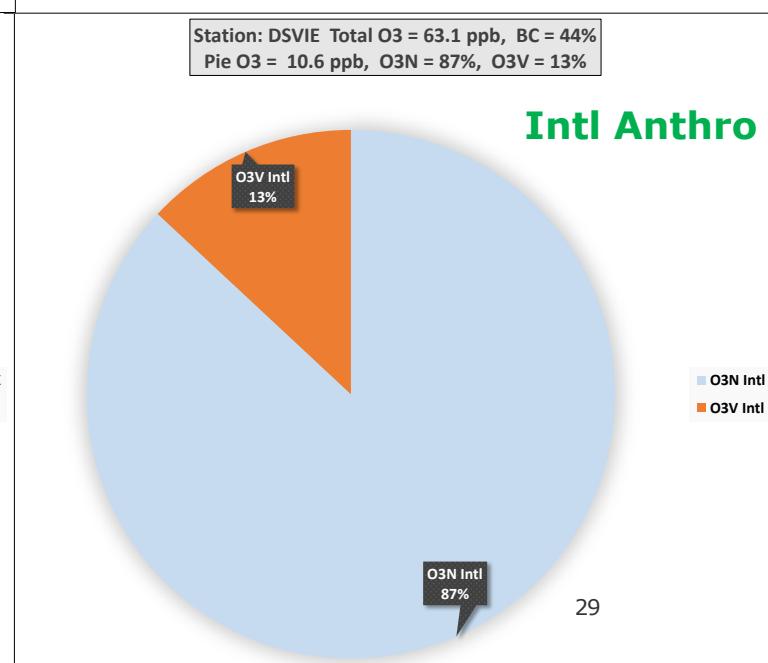

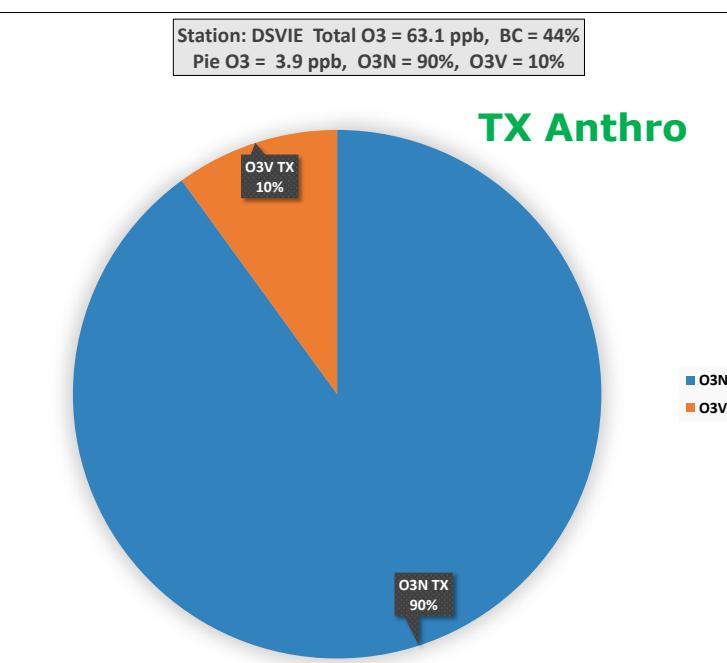

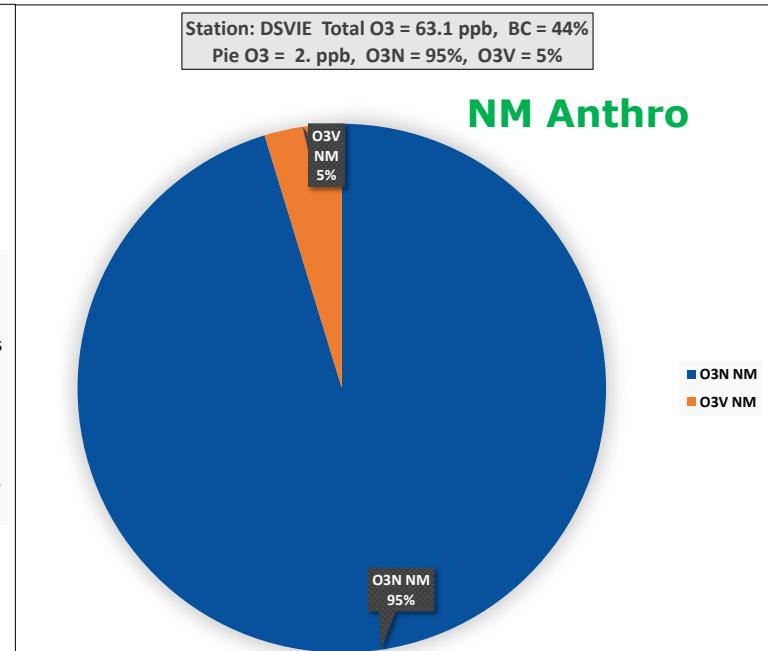

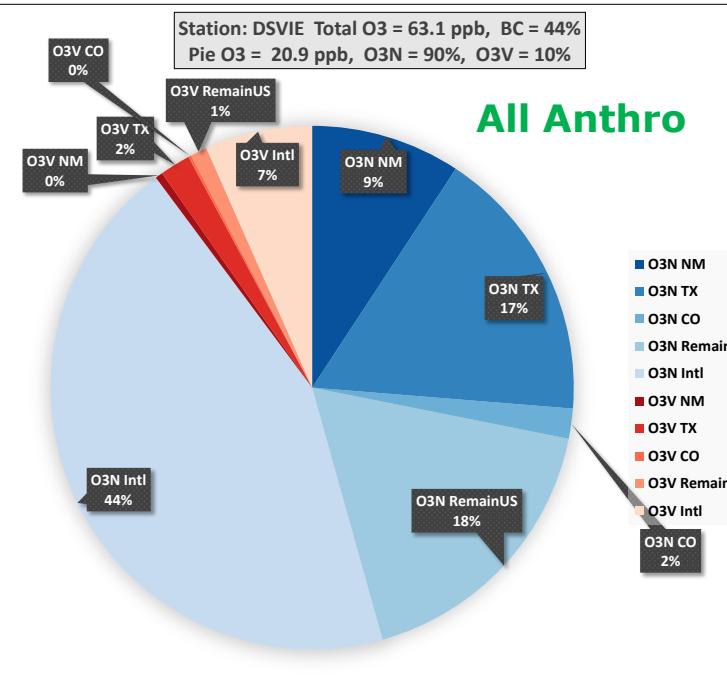

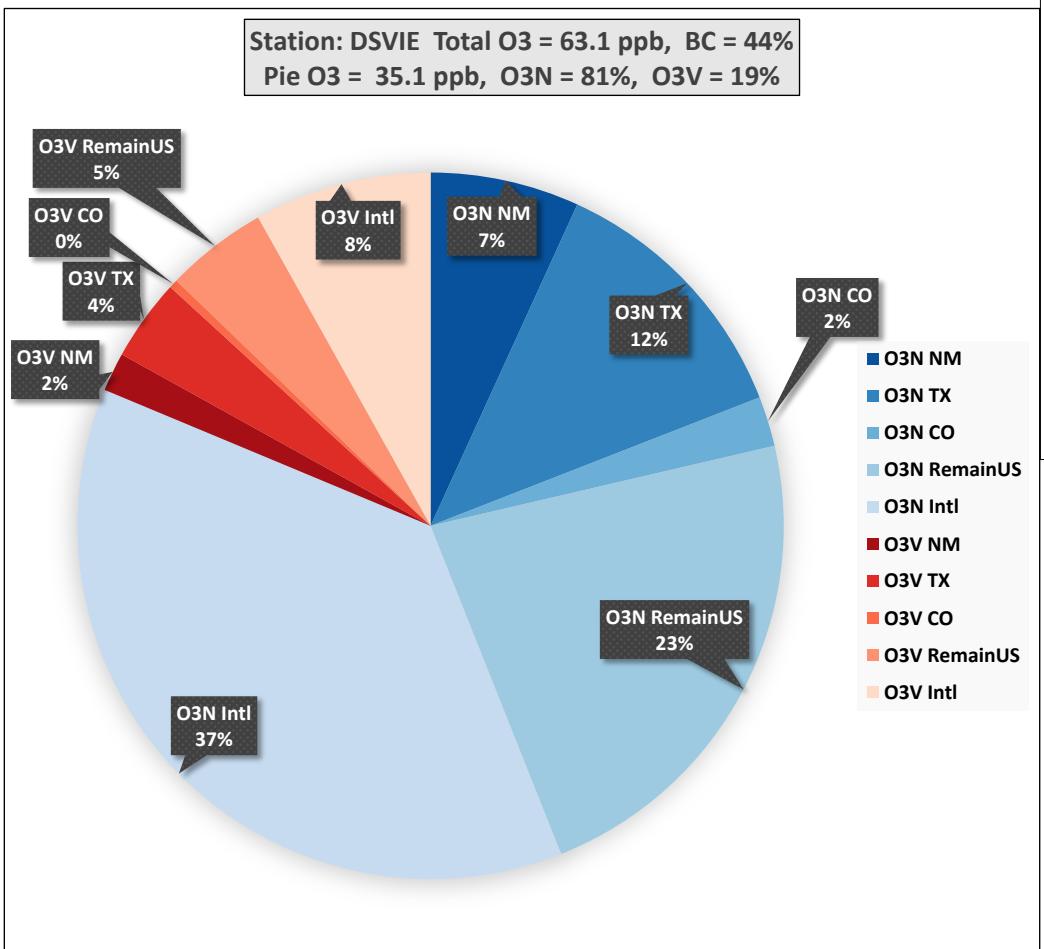

## New Mexico Anthropogenic

# Desert View, Dona Ana County

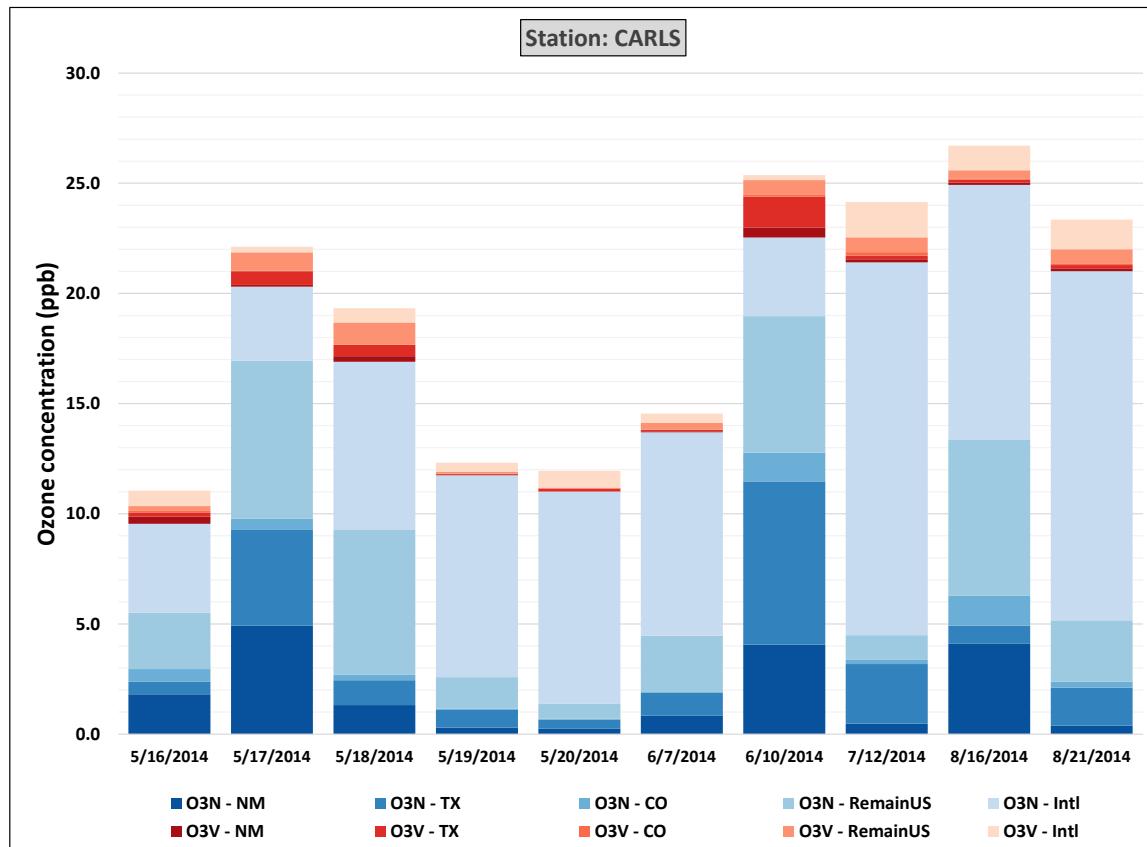

## Average 10 SMAT Days

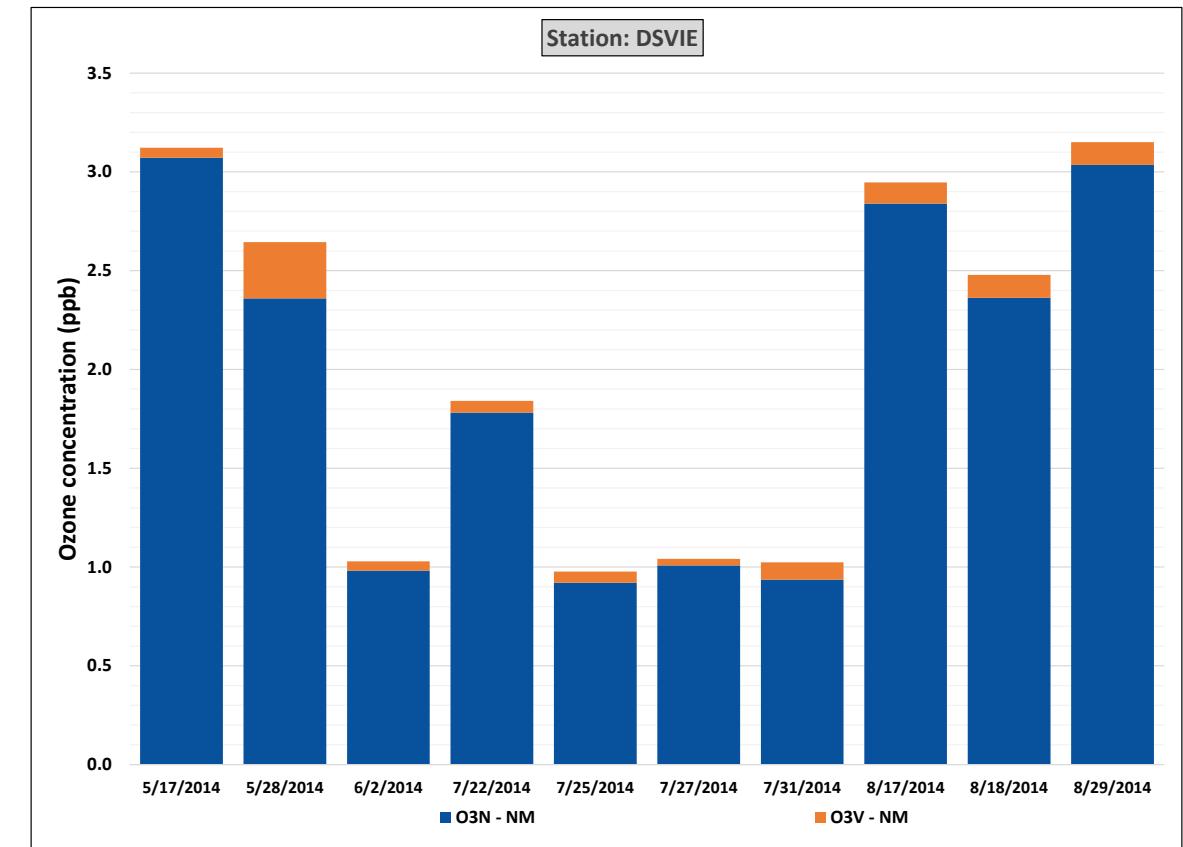

# CARLSBAD, EDDY COUNTY – 10 SMAT DAYS

- Mostly NOx sensitive ozone with New Mexico contributions even more NOx sensitive

## All Source Categories and Regions

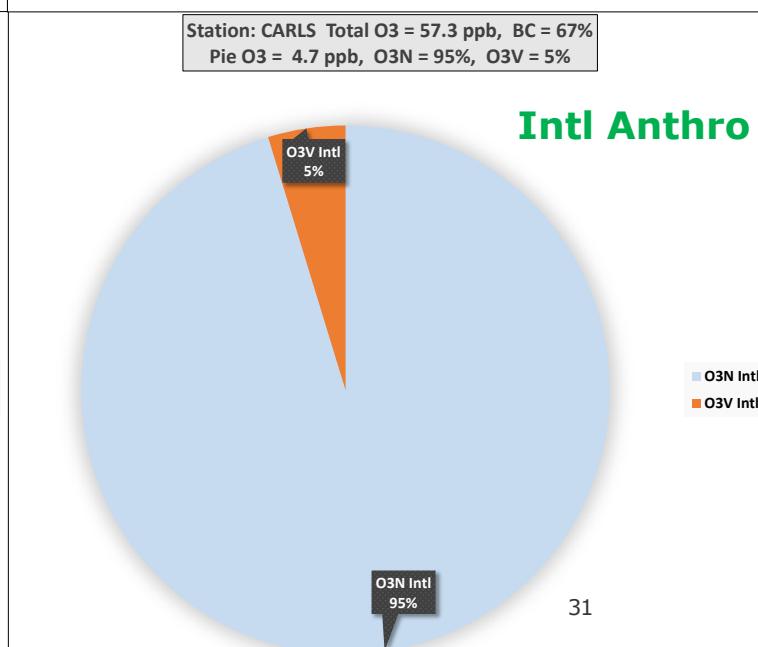

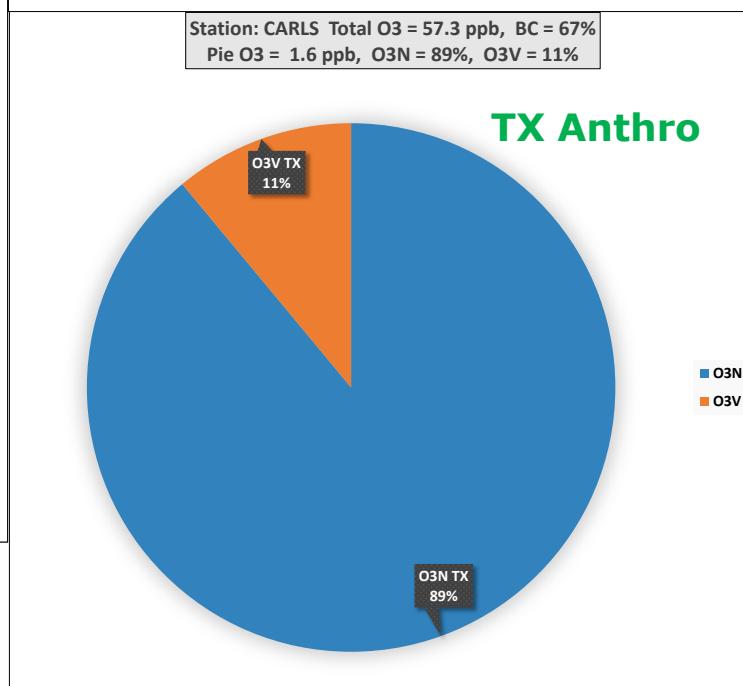

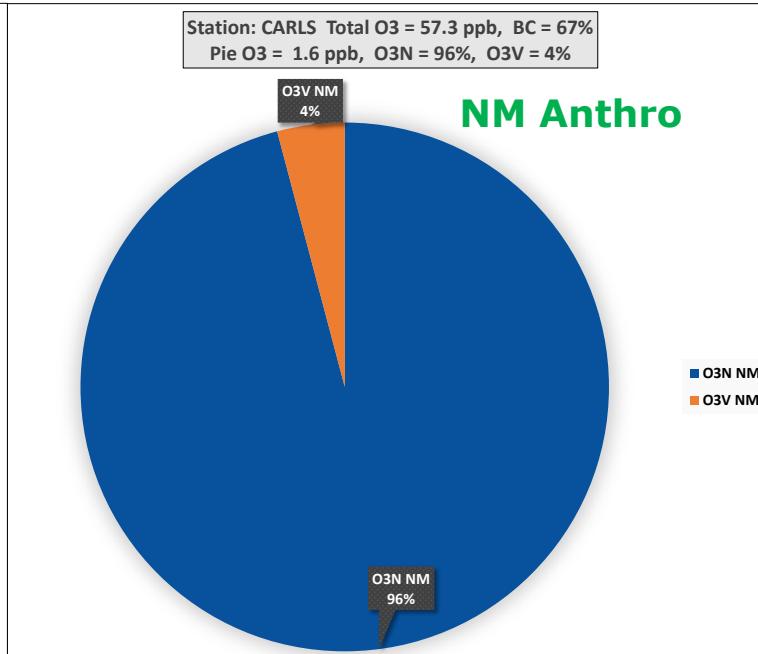

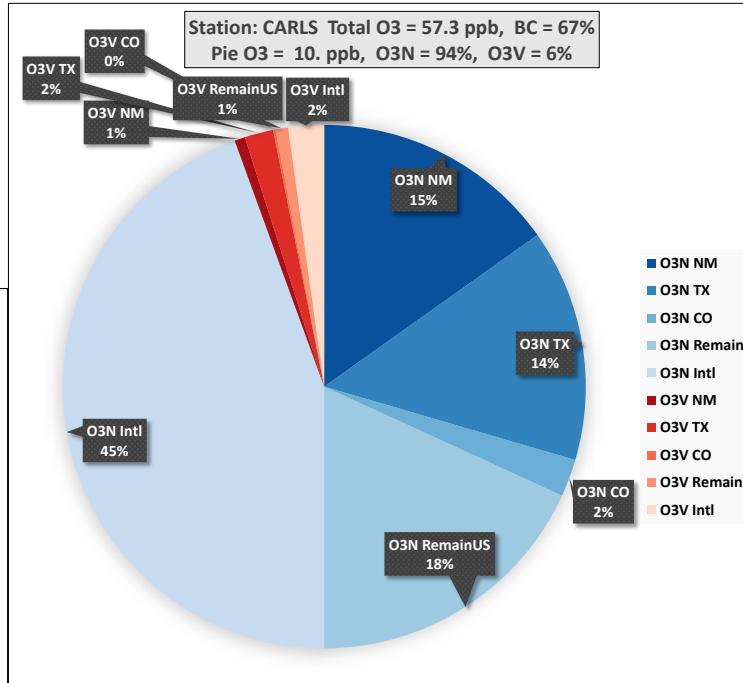

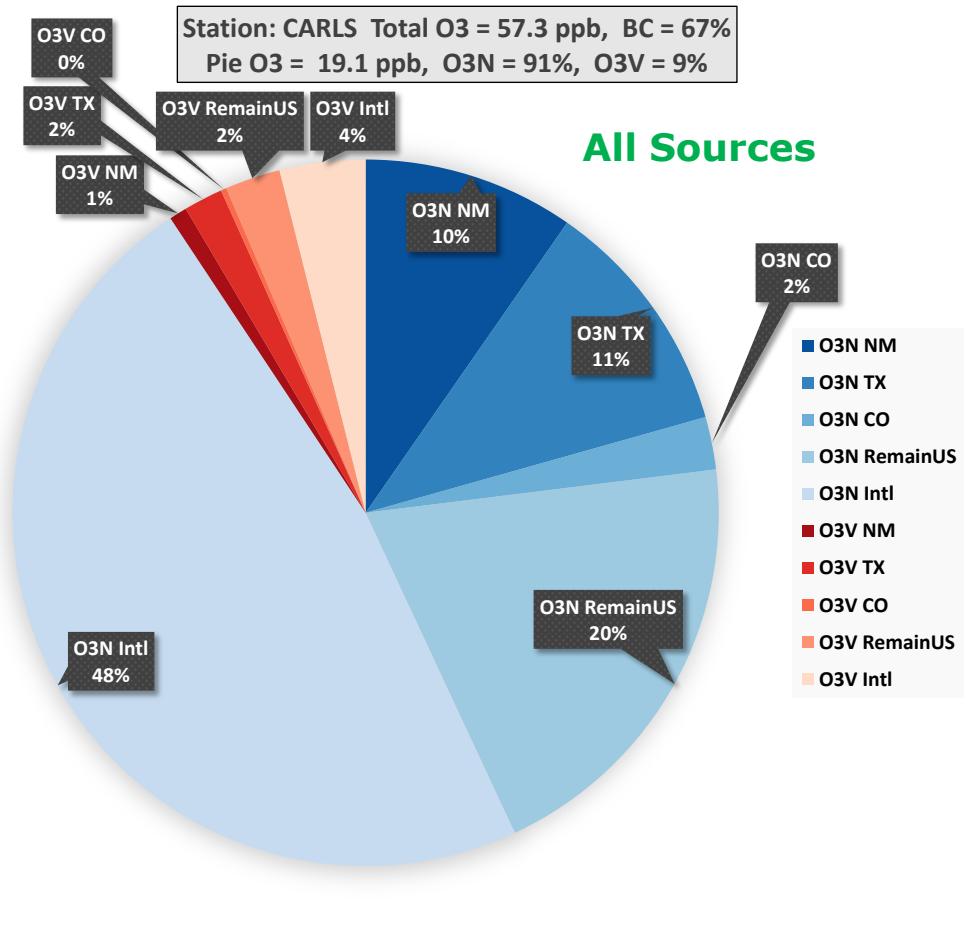

## New Mexico Anthropogenic

# Carlsbad, Eddy County

## Average 10 SMAT Days

## CONCLUSIONS VOC/NOX SENSITIVE OZONE OSAT SA

- The OSAT source apportionment suggests that ozone formation leading to elevated ozone concentrations in New Mexico is primarily NOx sensitive
  - Consistent with regional ozone modeling studies (e.g., OTAG) that found regional NOx emissions controls most effective at reducing regional ozone concentrations and ozone transport
    - VOC controls can also be effective in urban areas and other areas with concentrated emissions
- There are locations and days when there are higher amounts of VOC sensitive ozone formation:
  - San Juan Basin, El Paso-Juarez, Albuquerque and, to a lesser extent, Permian Basin
- The OSAT source apportionment provides a general indication of potential relative effectiveness of NOx vs. VOC controls for reducing ozone concentrations. It is not a substitute for actual control strategy modeling with explicit emission reductions of targeted sources.
  - Ozone formation is complex and reducing emissions changes the chemistry from the previous state that can cause non-linear responses in ozone concentrations
